Hands-on lab on Hadoop Map-Reduce (20 mins)

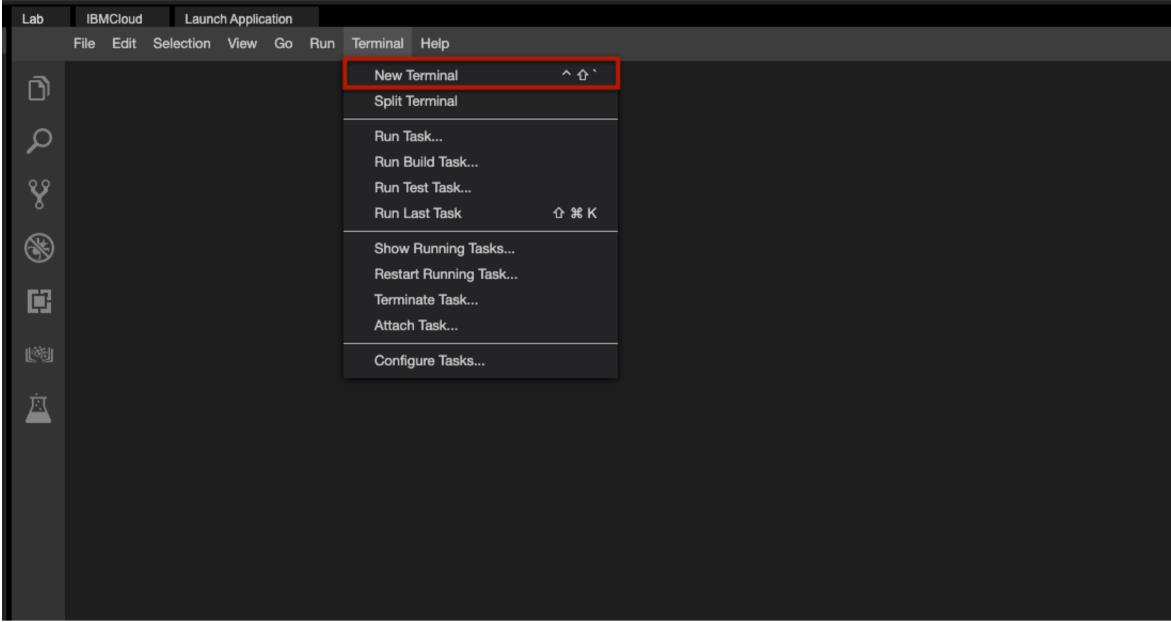

Objectives

- Run a single-node Hadoop instance
- Perform a word count using Hadoop **Map Reduce**.

Set up Single-Node Hadoop

The steps outlined in this lab use the single-node Hadoop Version 3.2.2. Hadoop is most useful when deployed in a fully distributed mode on a large volume of data. However, for basic understanding, we will configure Hadoop on a single node. In this lab, we will run the WordCount example with an input text and see how the content of the input file is processed by WordCount.

1. Start a new terminal

2. Download hadoop-3.2.2.tar.gz to your theia environment by running the following command.

C

(L)

1s output

You should see part-r-00000 with _SUCCESS indicating that the wordcount has been done.

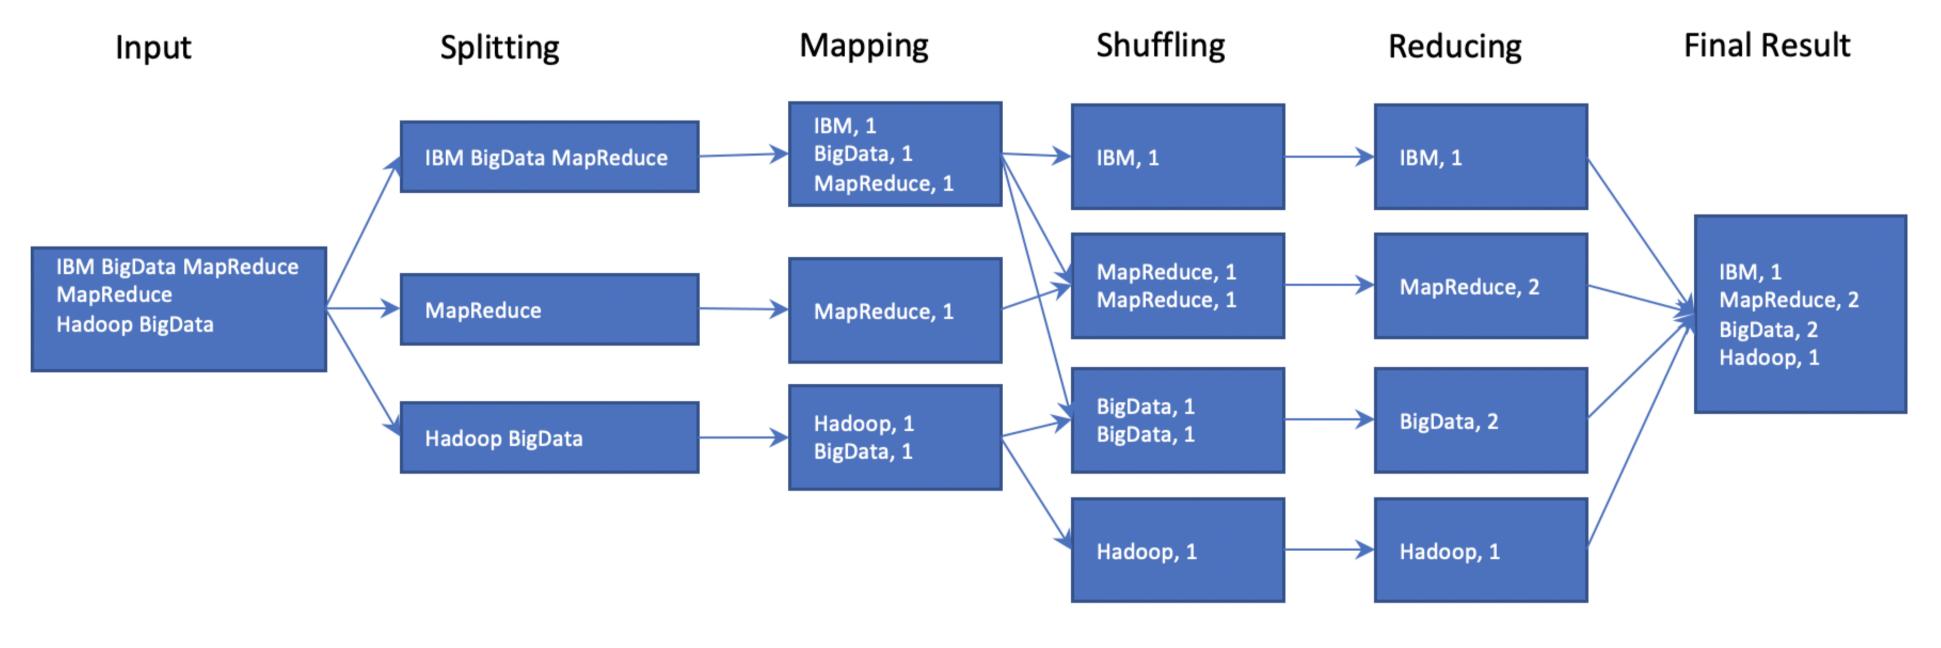

While it is still processing, you may only see '_temporary' listed in the output directory. Wait for a couple of minutes and run the command again till you see output as shown above.

9. Run the following command to see the word count output.

8. Once the word count runs successfully, you can run the following command to see the output file it has generated.

```
cat output/part-r-00000
theia@theiadocker-lavanyas:/home/project/hadoop-3.2.2$ cat output/part-r-000000
BigData 2
Hadoop
IBM
MapReduce
```

The image below shows how the MapReduce wordcount happens.

Practice Lab

Italy Venice Italy Pizza

Pizza Pasta Gelato

1. Do a word count on a file with the following content.

► Click here for a hint on how to get started

- ► Click here for hint on how to create a file to wordcount ► Click here for solution on how to do word count on the file
- ► Click here for sample output

Congratulations! You have:

- Deployed Hadoop using Docker Copied data into HDFS
- Used MapReduce to do a word count
- Tweet and share your achievement!
